Lab-18: Create Snapshots for VM (OS Disk and Data Disk)

Objective

To create snapshots of both the OS disk and data disk of an Azure Virtual Machine.

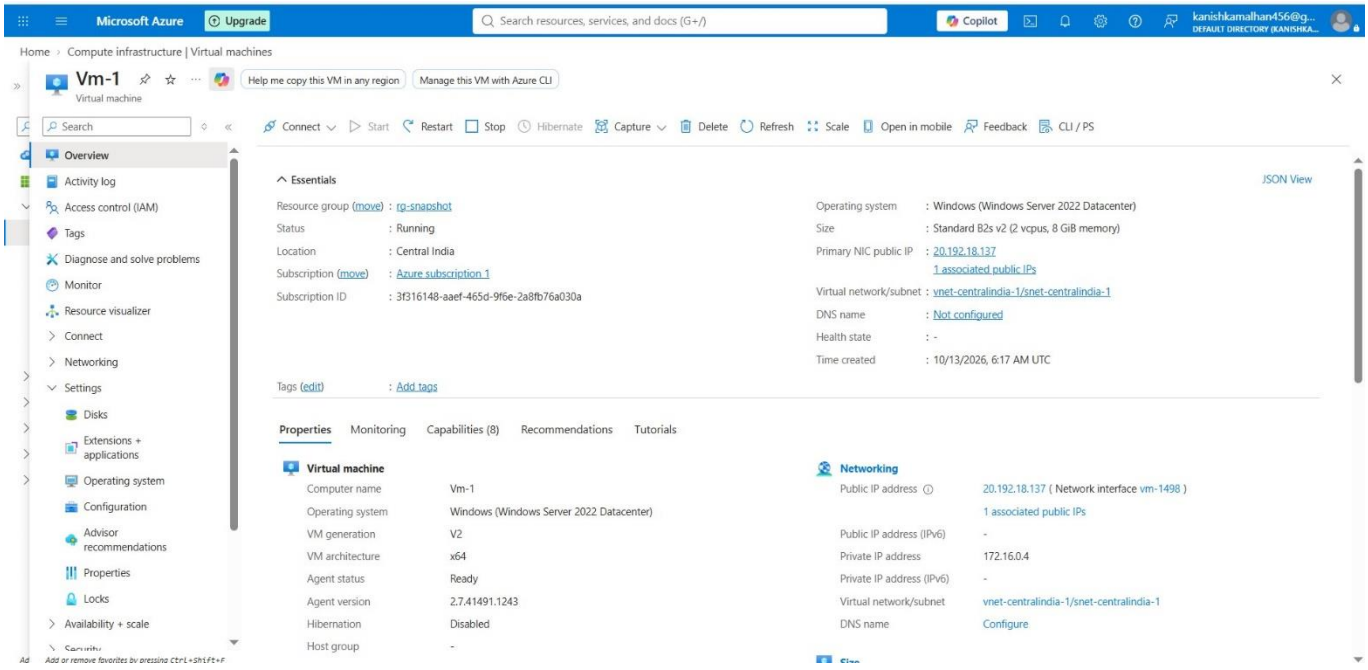

Step 1: View Resources in Resource Group

Open the `rg-snapshot` resource group and view the resources in Resource Visualizer. Verify that the VM, OS disk, data disk, and networking resources are available.

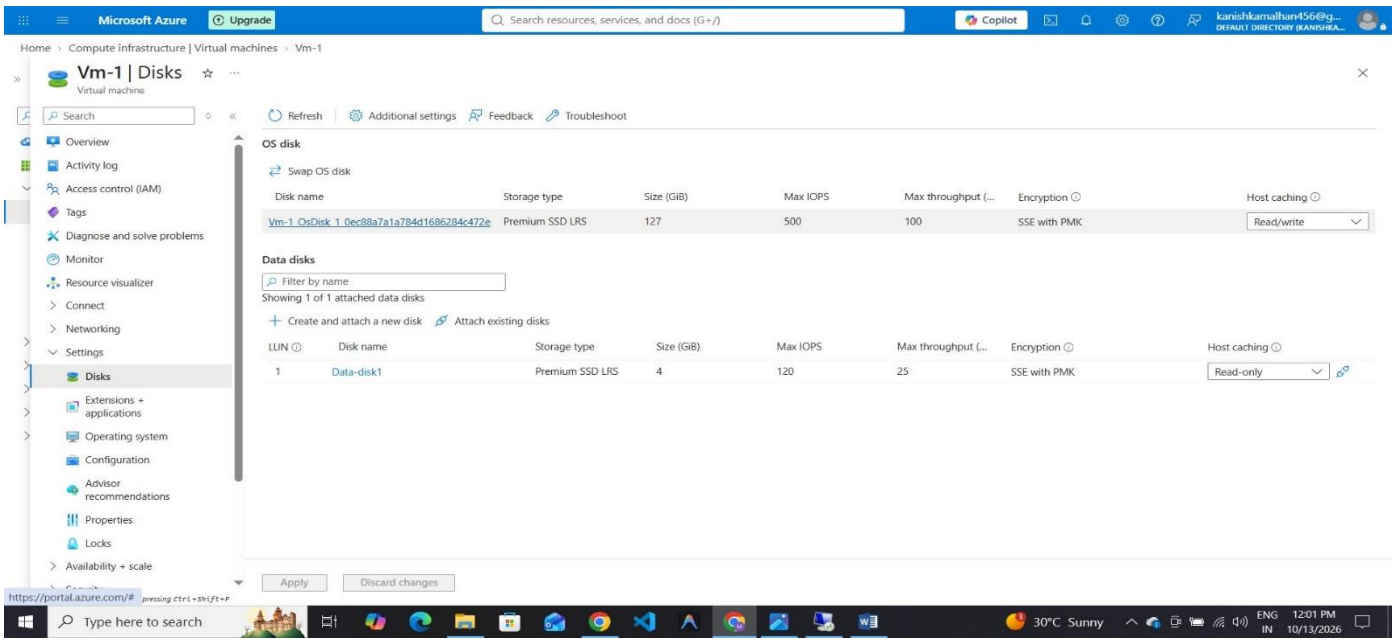

Step 2: Open the Virtual Machine

Open the virtual machine `Vm-1` from the Azure Portal. Check its status, operating system, region, and associated resources.

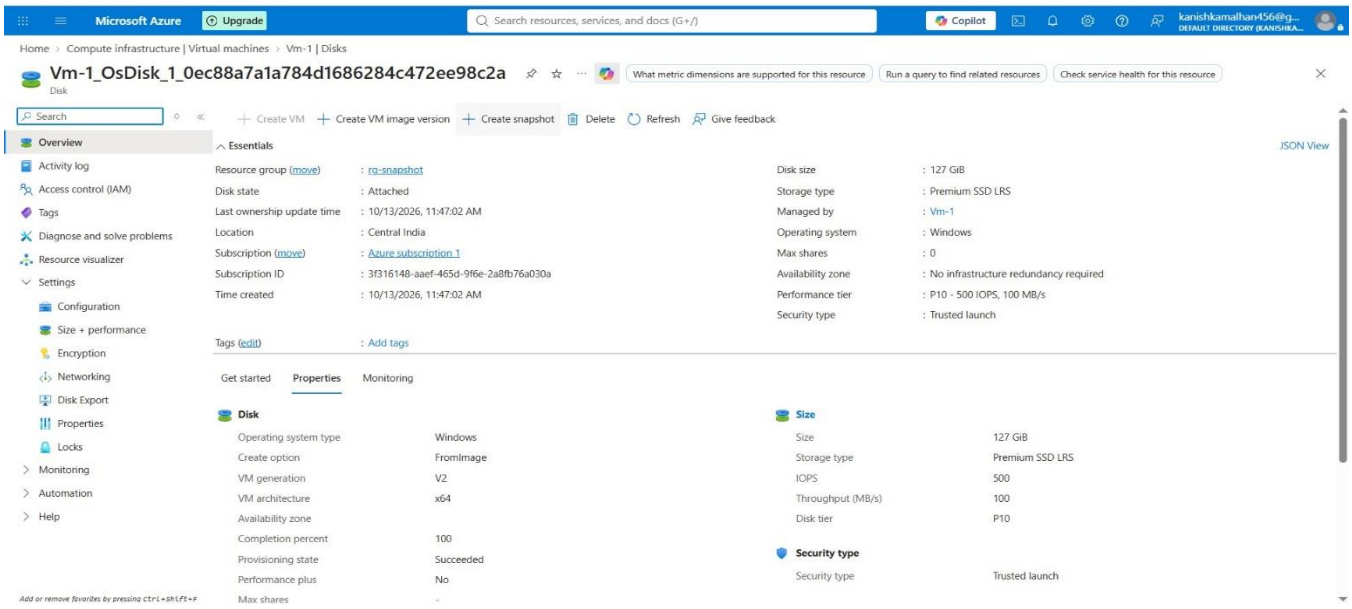

Step 3: View Attached Disks

Navigate to **Settings → Disks**. Verify that the VM has an OS disk and an attached data disk named `data-disk1`.

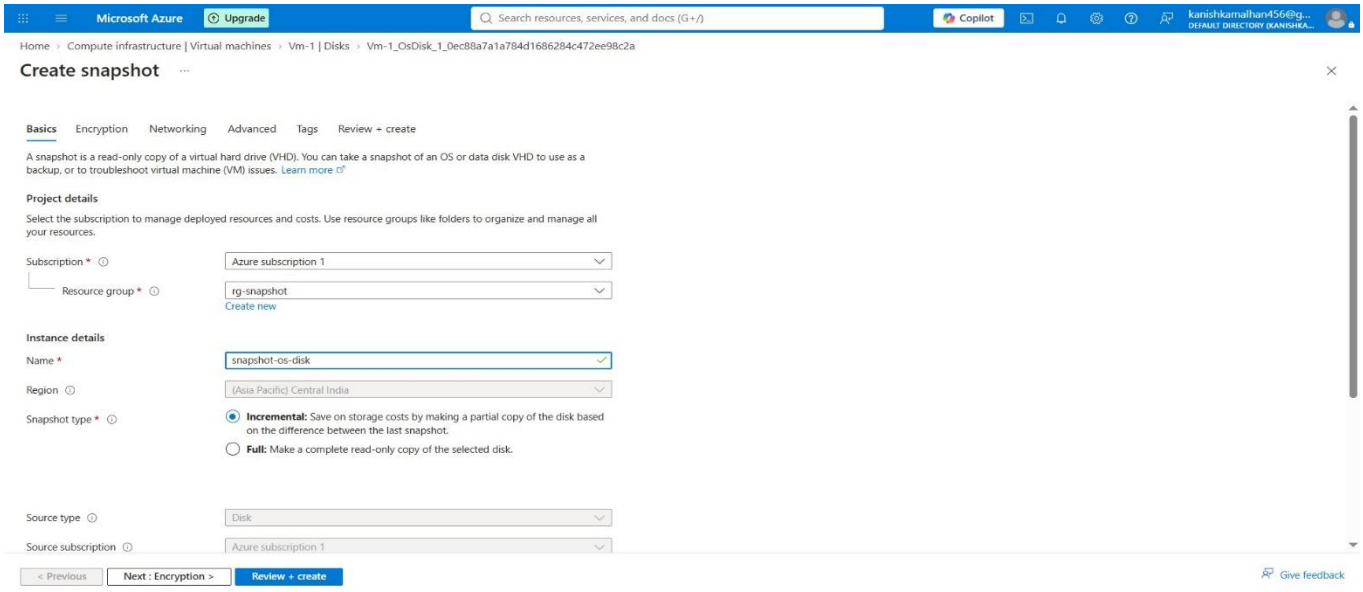

Step 4: Open the OS Disk

Click the OS disk name to open its Overview page. Verify its disk size, storage type, and that it is attached to `Vm-1`. Click **Create snapshot**.

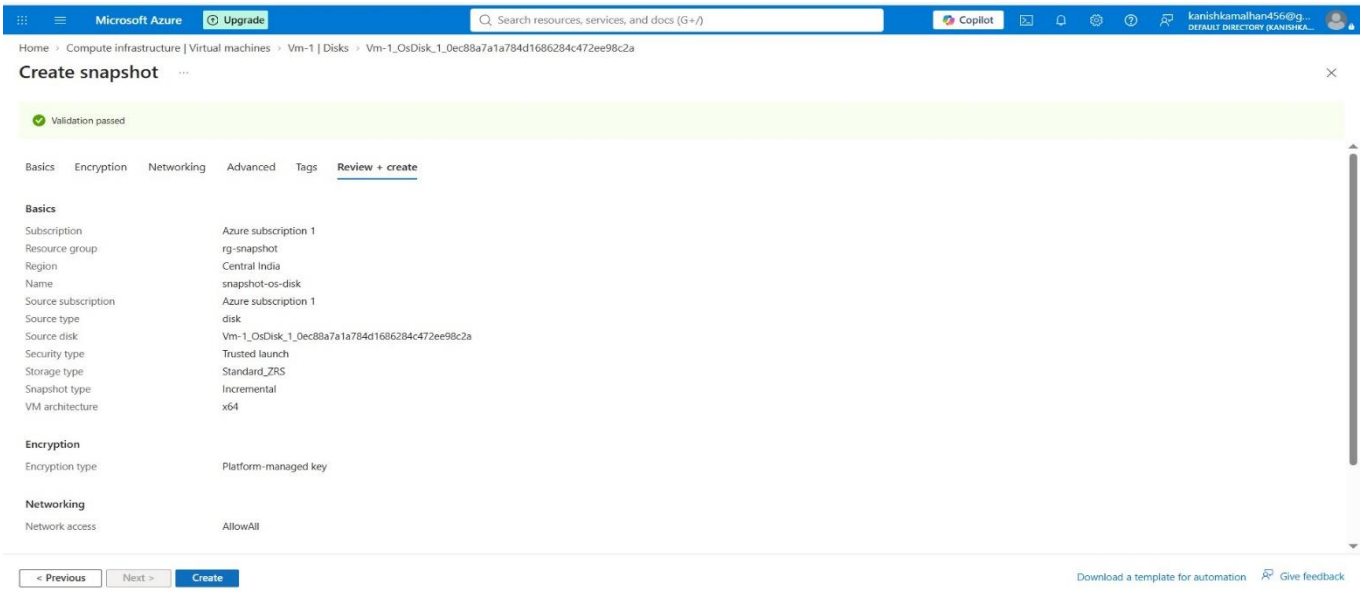

Step 5: Configure the OS Disk Snapshot

Enter `snapshot-os-disk` as the snapshot name. Select the subscription `Azure subscription 1` and resource group `rg-snapshot`. Keep the region as Central India and select **Incremental** as the snapshot type.

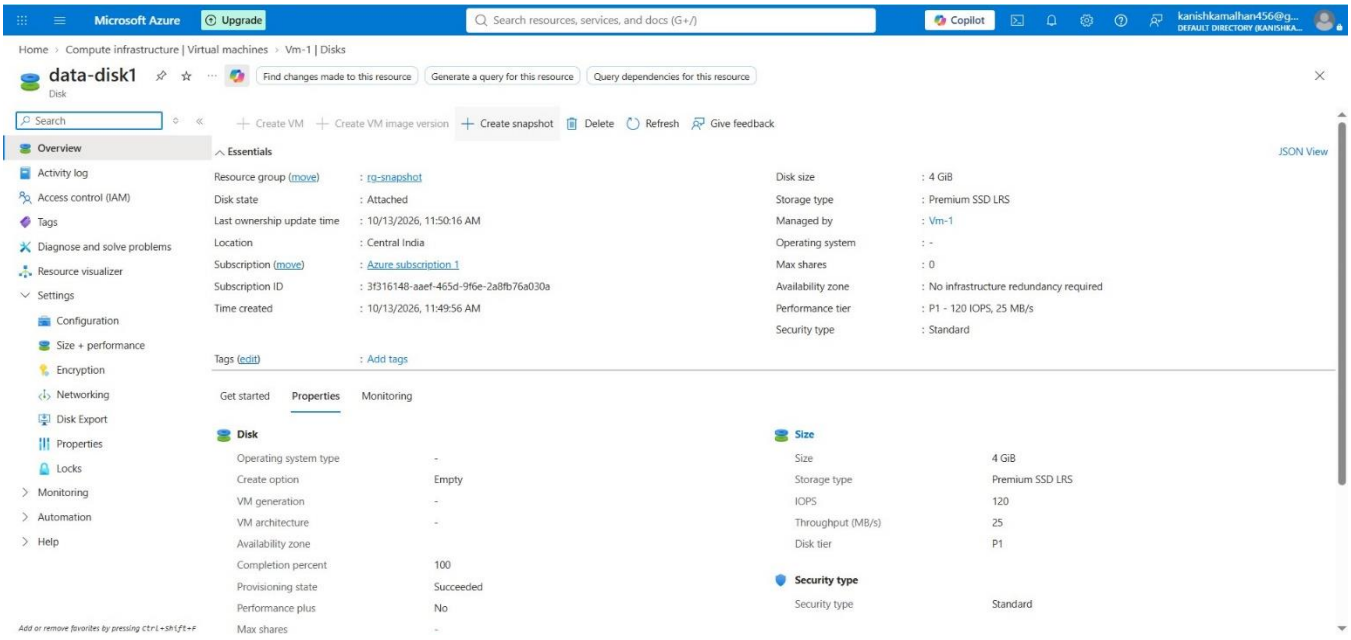

Step 6: Review and Create the OS Snapshot

Click **Review + create**. After validation passes, click **Create** to deploy the OS disk snapshot.

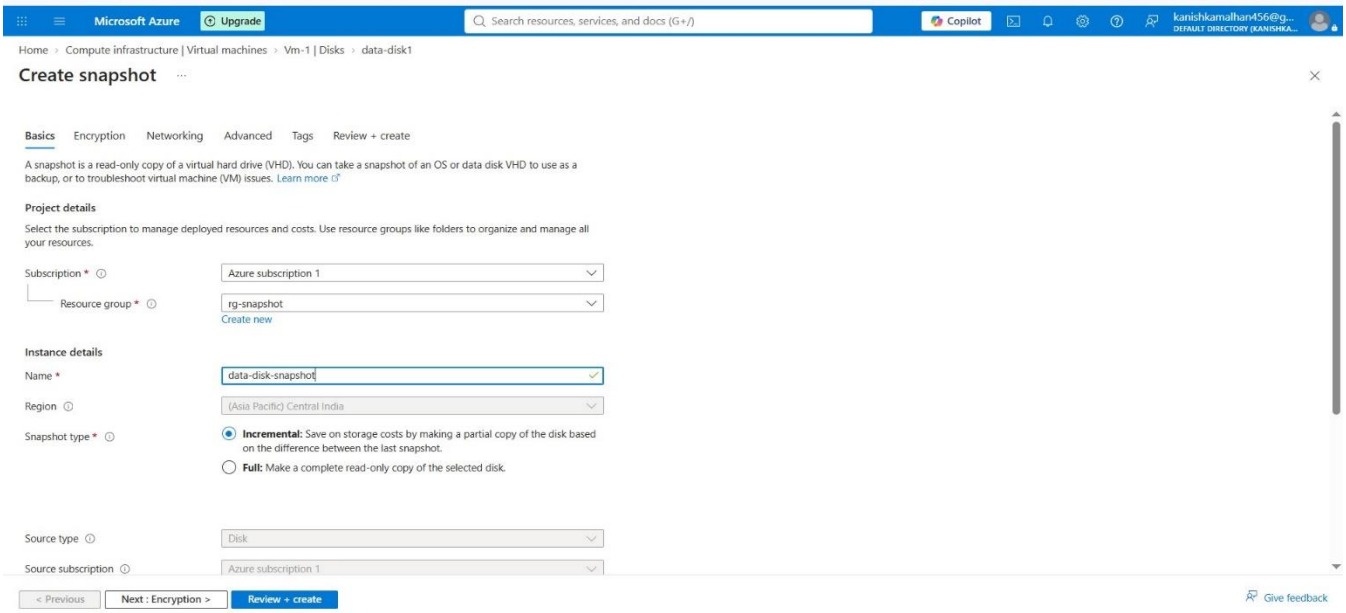

Step 7: Open the Data Disk

Return to the VM's Disks section and open the attached data disk `data-disk1`. Verify its details and click **Create snapshot**.

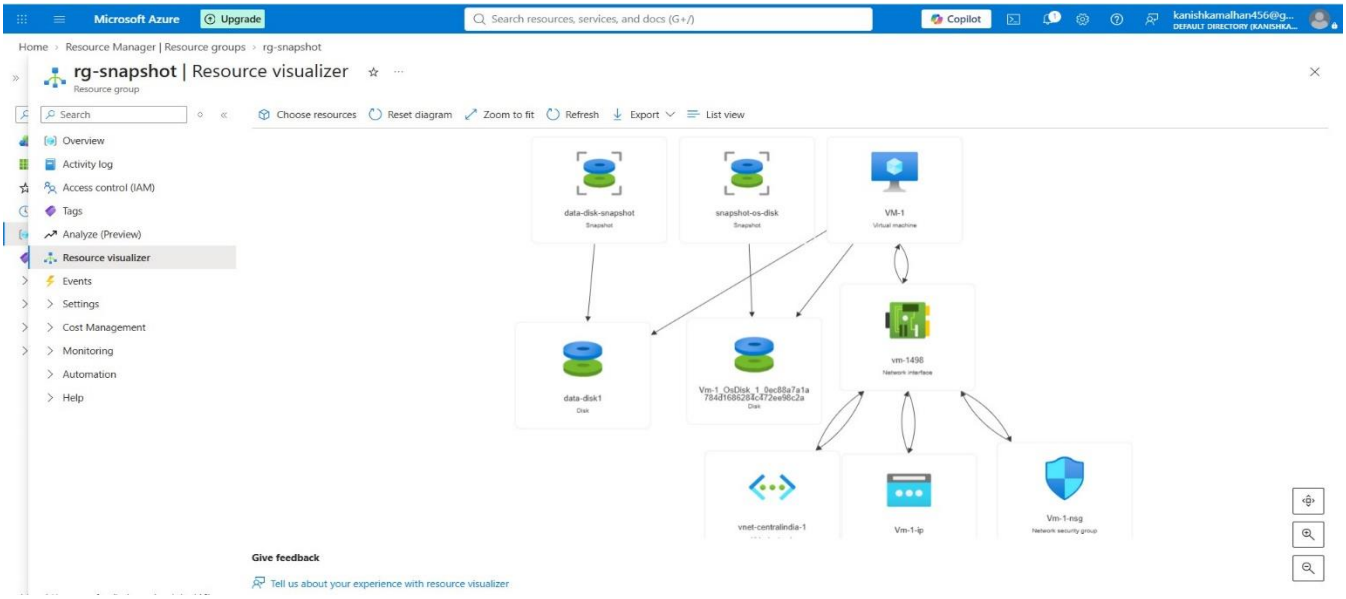

Step 8: Configure the Data Disk Snapshot

Enter `data-disk-snapshot` as the snapshot name. Select `Azure subscription 1` and resource group `rg-snapshot`. Keep the region as Central India and select **Incremental** as the snapshot type.

Step 9: Verify Both Snapshots

Open the `rg-snapshot` resource group in Resource Visualizer. Verify that both `snapshot-os-disk` and `data-disk-snapshot` have been created successfully.

Result

Snapshots of both the OS disk and data disk of VM `Vm-1` were created successfully.

Conclusion

Azure disk snapshots provide read-only copies of disks that can be used for backup, recovery, and troubleshooting.
